

Going... Going... Gone!

We live in a moment in history where change is so speeded up that we begin to see the present only when it is disappearing.

-Anonymous

It is always said that history repeats itself, but nobody actually believed that it would happen until that day on September 11, 2001, when the World Trade Center

was attacked by terrorists.

Many students were devastated, but they went on with their everyday normal lives. That includes doing projects in Global Studies over

the attacks.

"The vibes are there when listening to the radio or watching television when they're discussing the terrorists' attacks, but when looking up all the TRUE facts, that was when it touched me more than anything else," stated *TJ Good* sadly.

History isn't the only thing that happens in a hurry. The way things run -- and the way they can sometimes run our world -- is part of what technology is about, too.

Tech students became familiar with the tech-knowledge explosion. "Technology plays such a huge role in society today, that we should be thankful for the things we have. Most things we really take for granted. This is why I feel we need to stop...look around...and thank the many intelligent people who have created this world for us," commented *Ryan Bates*.
